

# INSTRUCTIONS FOR USE: CASTORS / FLOORS

## PARQUET FLOORS

Should not be walked on with wet or dirty outdoor shoes. Dust, stones, grains of sand, etc. can cause serious damage, particularly if these are pressed into the floor through loads, e.g. from shoes, castors of swivel chairs (some of these particles may be pressed into soft castors).

## STONE FLOORS

Spilling drinks (cola, alcohol, etc.) and treating these floors with acidic cleaning agents leads to an etching and disintegration of the lime shares contained in the stone. This in turn leads to damage following additional pressure loads from castors.

## LINOLEUM

Contains linseed oil, i.e. a fatty acid, as a raw material component. If basic cleaning is carried out with an alkaline cleaner (pH value > 10.5) the fatty acids together with the alkalines can cause a so-called saponification process. This produces soap that withdraws the main constituent of linoleum – the fatty acid – particularly in areas where the floor is subject to heavy loads (heavy through traffic, castors of swivel chairs, etc.) Strong discolourations, heavy wear, cracks and breaks may occur.

**We cannot be held liable for any claims for compensation resulting from this type of use.**

# CARE INSTRUCTIONS FOR THE COVER FABRICS AND TABLE TOPS

## Fabric

Regular cleaning maintenance: Please clean the upholstery at least once a month by using a vacuum cleaner with nozzle at low vacuuming power (500 watt) or brush in the direction of the fabric by using a soft brush. We would recommend using a professional cleaning company for linen or silk due to their delicate nature.

## Stain Removal

Stains are best removed by using a fabric cleaner e.g. PURATEX or an intense cleaner from LCK. Please test the colour fastness on a hidden section of the upholstery first. Hereafter, please follow the cleaning product instructions. Please do not apply the cleaning product directly onto the upholstery, use a soft cloth.

Please clean stains as soon as possible and always from the outside to the inside. In order to avoid any residual marks, please clean the entire area after this. Dab off moist stains with an absorbent cloth. We would like to ask you not to apply a lot of pressure when cleaning. The rubbing might change the surface of the upholstery.

If you have any permanent stains, please get in contact with our customer service or consult professional upholstery cleaners like company LCK furniture care ([www.möbelpflege.de](http://www.möbelpflege.de)).

## Leather

Leather is a natural product; it is unique similarly to the fingerprint of a person. Each leather hide has its individual character which is stretched for furniture. In contrast to fabric, leather is not as stretchy as fabric when used permanently or frequently. Therefore, the tension decreases and typically, wrinkles occur. Colour

variations may also occur because the leather absorbs the colour differently. Our employees do their very best to avoid colour variations. Please refer to "Manufacturing and Quality Regulations" for further information.

## General Remarks

Please do not use any cleaning products containing solvent, shoe polishing or beeswax. Do not leave leather close to the heating. Please use special leather cleaning products only, e.g. KERALUX. KERALUX products from LCK were developed by tanneries and upholstery companies and therefore, fulfil high-quality furniture leather requirements. Please see [www.lederpflege.de](http://www.lederpflege.de) for further information.

## Maintenance

It is recommended to wipe the leather once a week in order to remove dust from pores. Every half year, please clean the leather thoroughly. Please use a product similar to KERLUX leather cleaning product set A or cleaning product set P (for Semi-Aniline leather or coated leather). Firstly, the leather is cleaned thoroughly, thereafter;moisturiser is applied to prevent the leather drying out.

## Stain Removals

Leather stains can be removed with KERALUX intense cleaner. For special stain remover e.g. suitable for ballpoint-pen stains, please refer to [www.lederpflege.de](http://www.lederpflege.de).

## Synthetic leather

Apart from its appearance, synthetic leather does not have any characteristics in common with real leather. For this reason, it needs to be taken care of differently. Unlike real leather,

which needs care and cleaning, synthetic leather needs cleaning only. This is due to its surface coating (PVC, PC) which does not require any care substances.

## Regular Maintenance

Please use a moist cloth in order to dust off the synthetic leather.

## Cleaning

In order to remove stains, please use special synthetic leather cleaner from LCK. Please test at a hidden section first.

## Protection

For light synthetic leather it is recommended especially to use an intensive protector from LCK. These products help to prevent the build-up of dirt in areas of abrasion caused by jeans for example.

## Veneer

Maintenance:

Please dust the veneer regularly using a dry, soft and lint-free cloth. Depending on the wood, please use special wood care products like SILVAPUR care set by LCK for varnished or oiled/waxed woods.

## Laminates

Maintenance:

Please dust the veneer using a dry, soft and lint-free cloth. Please use standard laminate cleaning products for stain removal. If you have any queries, please get in contact with our service department ([info@möbelpflege.de](mailto:info@möbelpflege.de)) or LCK ([www.möbelpflege.de](http://www.möbelpflege.de)).
